

Prioritisation merits a bounded investment

Simple profiles reveal a useful ranking signal

ITERATE

Validate a simple policy before scaling engagement decisions.

Extra inputs must demonstrate additional value.

Target: substantial subsequent increase in new prescriptions, as supplied.

2,100 HCPs · 48,585 labelled months · 12,723 required scores

Data meaning and timing constrain the evidence

Strict response by operational flags

Availability

Late updates; follow-up missing in 87.8% of scoring rows.

Measurement

Prescription scales change. Attendance histories conflict with their stated definition.

**52.1% of checked strict positives show growth under an immediate-month comparison.
The official outcome formula remains unresolved.**

A fixed recipe, evaluated forward in time

	FIT THROUGH		LABEL GAP		EVALUATE / SCORE
Development	May 2025	——	Jun 2025	——	Jul–Sep 2025
Later check	Aug 2025	——	Sep 2025	——	Oct–Dec 2025
Final scoring	Nov 2025	——	Dec 2025	——	Jan–Jun 2026

4 core inputs

Decile · Specialty
Formulary status · Competitor share

7 additional inputs in the delivery

Region · Institution type · Years in practice
Emails sent · Emails opened · Digital engagement
Commercial payer mix

No broad parameter search or automated deployment. Input availability remains provisional.

Simple alternatives capture much of the signal

Precision among selected positions

Monthly selection capacity · view: 1–30%

At 10%: 11-input model 164 positives; table 161 — 608 monthly positions.

Difference: +0.50 points · Conditional 95% interval: -2.96 to +2.30

Why retain eleven?

Development selection: average precision and precision at 5%, 10% and 20%.

Results vary by capacity and period.

No consistent replacement established.

HCP history is promising; its added value is uncertain

27.47%

Comparable core

28.46%

Core + history

Same fitting rows for both models:
Jan–Feb 2024 omitted where history is unavailable.

Slide 4 core: 27.30%, using all eligible fitting months.

+0.99 percentage points

Conditional 95% interval on the difference

−0.82 to +2.30 points

History deserves fresh evaluation. It is not in the delivered model.

ITERATE: validate a simple prioritisation policy

Fund a bounded validation; hold model complexity fixed.

SCALE

Validated data and prospective incremental net value at actual capacity and cost.

SIMPLIFY

Fewer dependencies meet the commercial need; extra inputs do not earn their cost.

STOP / REDEFINE

The target cannot be reconciled, or the advantage disappears after correction.

Working expectation: 27% precision at illustrative 10% capacity.

Main risk: correcting the target or decision-time inputs removes the measured signal.

Two weeks + one engineer

Agree the policy comparison before outcomes arrive.
Scale: net-value lower 95% bound > 0 ; gain $\geq$ agreed minimum.
